

World Aquaculture Performance Indicators (WAPI)

WAPI is an FAO initiative to develop user-friendly tools for compiling, generating and providing easy access to quantitative information on aquaculture sector performance at the national, regional and global levels. WAPI information and knowledge products include data analysis tools, technical papers and policy briefs.

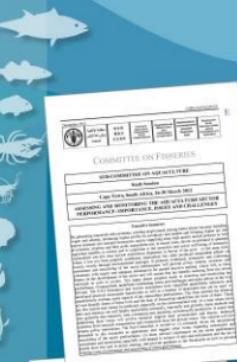

Data analysis tools

- **WAPI Aquaculture Production Module (WAPI-AQPRN)** analyses the status and trends of aquaculture production (quantity and value) of over 650 species items in nearly 250 countries and areas under different farming environments (inland waters, marine areas and all areas) for seven decades, from the 1950s to the 2010s.

- **WAPI Fish Consumption Module (WAPIFISHCSP)** includes 10 indicators – three nutrition indicators and seven food indicators – to examine food supply and utilization patterns (with a focus on the contribution of fish to food and nutrition) in 270 countries and areas for six decades, from the 1960s to the 2010s. The module focuses on 14 fish/seafood items, but also includes 26 nonfish/seafood items.

Global seaweeds and microalgae production, 1950–2019

WAPI factsheet to facilitate evidence-based policy-making and sector management in aquaculture

June 2021

Preparation of this factsheet

- This factsheet is based on FAO statistics on aquaculture and fisheries production. The data and statistics, which were the most updated at the time when the factsheet was prepared, may differ from data and statistics used in other WAPI factsheets because of different data sources or different versions of the same dataset. They may not be consistent with data and statistics from other sources.
- The term "country" used in this factsheet includes non-sovereign territory. The designations employed and the presentation of material in this information product do not imply the expression of any opinion whatsoever on the part of the Food and Agriculture Organization of the United Nations (FAO) concerning the legal or development status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.
- The factsheet follows the grouping of Landlocked Developing Countries and Small Island Developing States ([SIDS](#)) adopted by the UN Office of the High Representative for the Least Developed Countries, Landlocked Development countries and Small Island Developing States (UN-OHRLS): <http://unohrlls.org/about-sids/country-profiles/>. Unless noted otherwise, other country grouping in this factsheet follows the United Nations [M49 standard](#).
- The preparation of the factsheet has benefited from tables and charts generated by various World Aquaculture Performance Indicator (WAPI) modules. Most of these data analysis tools are for FAO internal use, yet some of them are available for test use. Visit the [WAPI webpage](#) for more information about WAPI information and knowledge products.
- The factsheet was prepared by Junning Cai and Giulia Galli. Valuable comments and suggestions provided by Esther Garrido Gamarro and Giorgos Paximadis are acknowledged. The validity and relevance of the results depend on the quality (in terms of timeliness and accuracy) of the underlying data and statistics used in the analyses. Errors could also occur in the analyses despite our efforts to minimize them. Simple text are provided to help users understand the tables and charts. Users may use the original data sources to verify the results. We welcome your feedback to help us improve the factsheet.
- Contact: Junning Cai (FAO Aquaculture Officer); junning.cai@fao.org; wapi@fao.org.

World

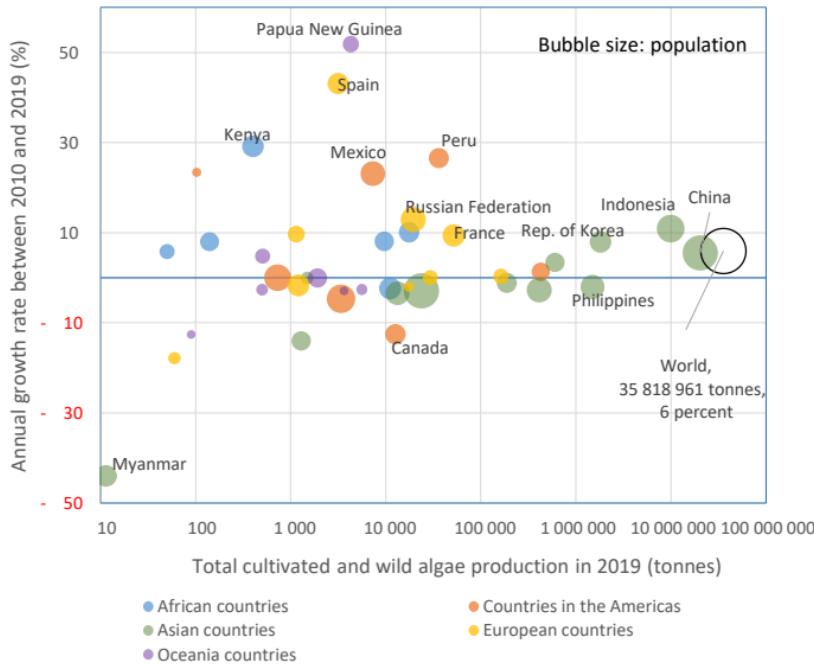

Global algae production (including cultivation and wild collection) increased over 60 times from 0.56 million (wet) tonnes in 1950 to 35.82 million tonnes in 2019; nearly all the growth was contributed by cultivation.

Data source: FAO 2021. FAO Global Fishery and Aquaculture Production Statistics (FishStatJ; March 2021; www.fao.org/fishery/statistics/software/fishstatj/en).

In 2019, 35.8 million tonnes of world algae (including seaweeds and microalgae) production was contributed by 54 countries/territories with 97 percent of the production coming from cultivation.

Status and trend of global production of algae (including seaweeds and microalgae), 2019 versus 2010

Data source: FAO 2021. FAO Global Fishery and Aquaculture Production Statistics (FishStatJ; March 2021; www.fao.org/fishery/statistics/software/fishstatj/en).

No data on cultivation production

Seaweeds

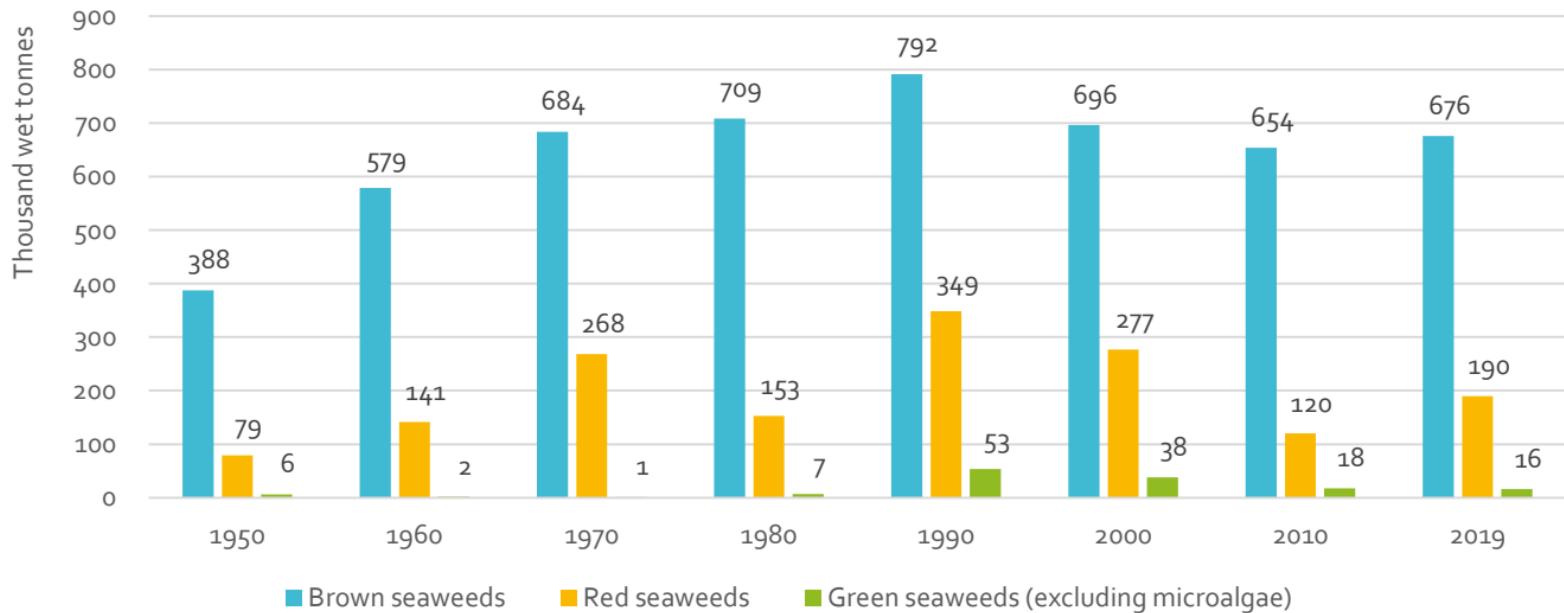

In 1969, the 2.2 million tonnes of world seaweed production was evenly contributed by wild collection and cultivation. After half of a century, while the wild production remained at 1.1 million tonnes, the cultivation production has increased to 34.7 million tonnes that accounted for 97 percent of the world seaweed production in 2019.

Data source: FAO 2021. FAO Global Fishery and Aquaculture Production Statistics (FishStatJ; March 2021; www.fao.org/fishery/statistics/software/fishstatj/en).

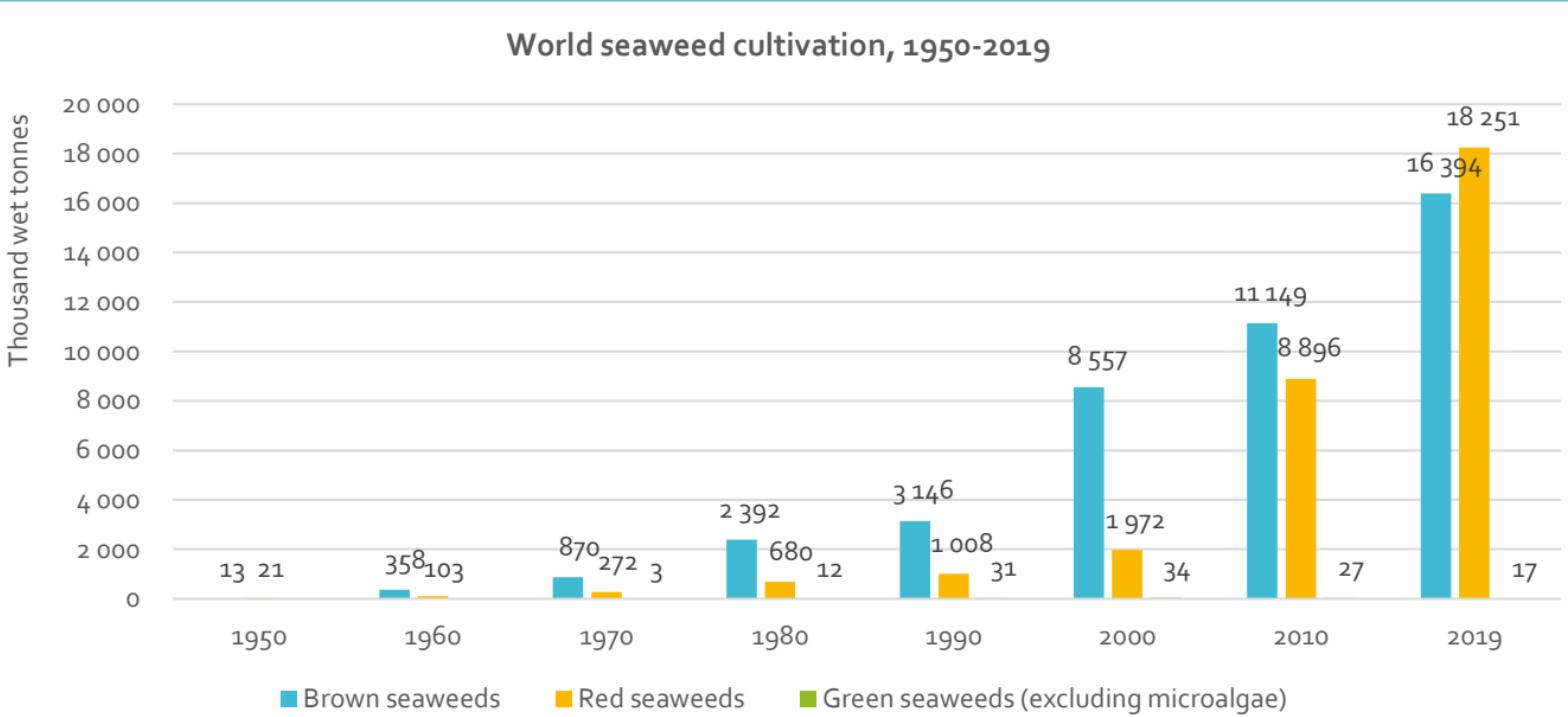

World wild seaweed collection declined from 1.33 million tonnes in 1990 to 1.08 million tonnes in 2019, and the decline occurred to all the three seaweed groups, i.e. brown seaweeds (from 792 000 tonnes to 676 000 tonnes), red seaweeds (from 349 000 tonnes to 190 000 tonnes); and green seaweeds (from 53 000 tonnes to 16 000 tonnes).

World wild seaweed collection, 1950-2019

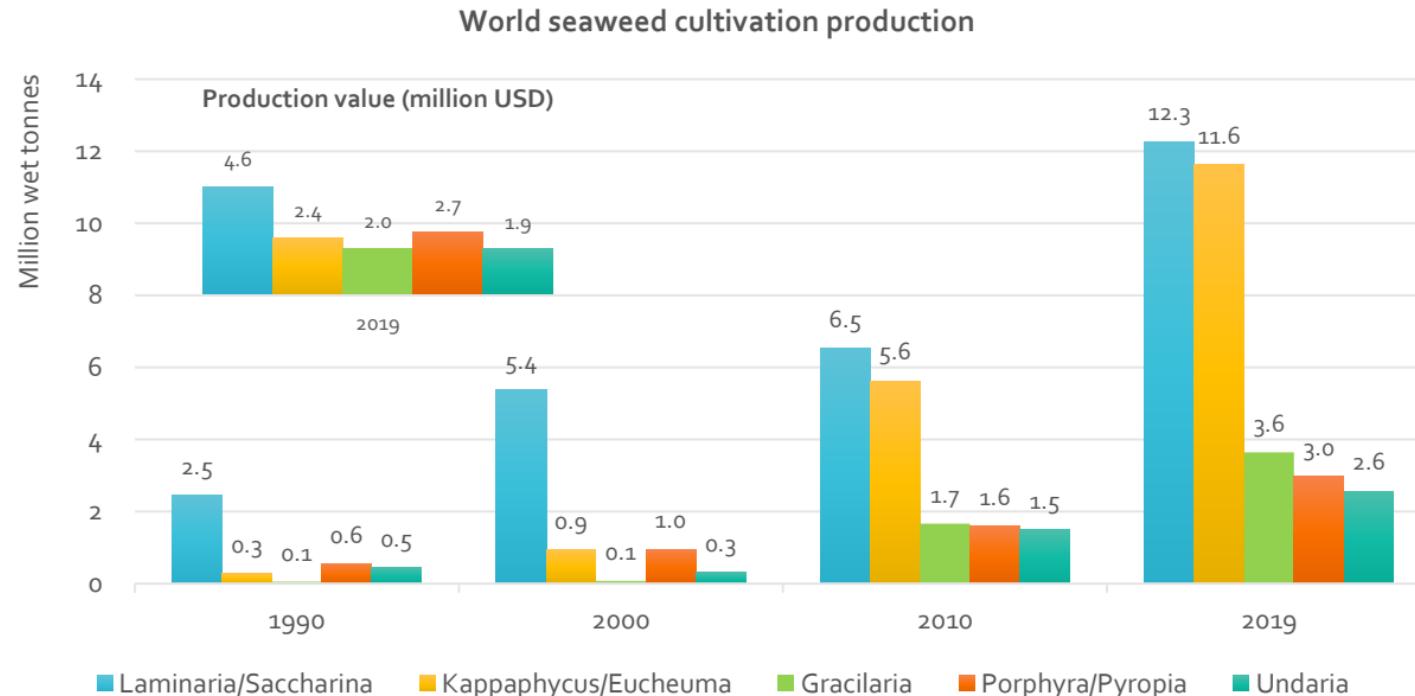

Data source: FAO 2021. FAO Global Fishery and Aquaculture Production Statistics (FishStatJ, March 2021; www.fao.org/fishery/statistics/software/fishstatj/en).

World seaweed cultivation increased from 4.2 million tonnes in 1990 to 34.7 million tonnes in 2019. The growth was contributed by brown seaweeds cultivation (from 3.1 million tonnes to 16.4 million tonnes) and red seaweeds cultivation (from 1 million tonnes to 18.3 million tonnes), whereas green seaweeds cultivation declined from 31 000 tonnes to 17 000 tonnes.

Data source: FAO 2021. FAO Global Fishery and Aquaculture Production Statistics (FishStatJ, March 2021; www.fao.org/fishery/statistics/software/fishstatj/en).

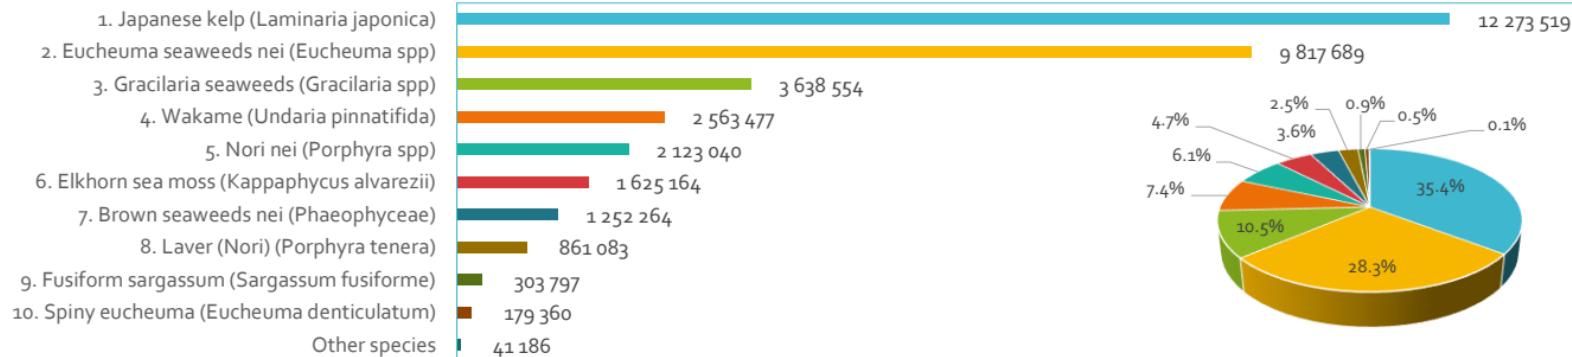

Five species groups accounted for over 95 percent of world seaweed cultivation production in 2019; they are *Laminaria/Saccharina* (35.4 percent); *Kappaphycus/Eucheuma* (33.5 percent); *Gracilaria* (10.5 percent); *Porphyra/Pyropia* (8.6 percent); and *Undaria* (7.4 percent).
